

# PST Usage

Using PST

## User's Information

- You can lookup all of the information on a user that Minecraft manages. This includes, but is not limited to, health, hunger, fly status...etc.
- I hope to later expand this to other plugins, like economy plugins to provide a more detailed print out

## Maintenance Mode

- Maintenance mode was designed to provide you with an alternative to whitelisting. When enabled, only users with admin or helper permissions will be able to join the server
- This is especially useful for building or configuring new plugins so you're not disturbed

## Plugin Stealing Protection

- Most servers forget that players can easily access a list of their plugins by using commonly unprotected commands. PST automatically prevents users from accessing these commands unless they have PST admin permissions

## Memory Protection

- PST monitors your servers RAM usage in order to protect you from unexpected crashes and data loss.
- You can view your servers memory usage and information by executing `/pst memory`
- In the event your memory usage spikes into an unsafe or unexpected range, anyone with PST.admin permissions will be notified. It won't annoy the hell out of you, don't worry. If your memory spikes to 90%, you won't get another message until it hits 91%
- You can disable memory protection in `global.yml`
